

## Futrex 6100A/ZL

Futrex body fat measurement is based on the measuring principle of near infrared light technology and specifies the percentage of body fat, fat-free mass, water content, BMI and the basal metabolic rate.

The measurements are usually performed on the biceps, although they can also be performed locally (e.g. abdomen, hips, waist, legs, etc.). The device is suitable for both children (from 5 years of age), as well as for adults.
