

VO2 Master

The VO2 Master is a mobile spiroergometry device. During spiroergometry, the inhaled and exhaled breaths are analyzed with regard to their volume and oxygen and carbon dioxide content. On the basis of the course of these ratios during an exertion, it is possible to make statements about the athlete's performance and different training ranges. The VO2 Master is very portable and does not need any tubes. The device can be controlled with the VO2 Master Manager app.
